

**CARPENTER'S  
COMPLETE  
INC.**

*Home Elevation Specialist*

Raising your home is an intricate process that comes with many questions for the homeowner. This document is designed to alleviate some of the concerns about raising your home and put your mind at ease by helping to answer those questions. When you choose Carpenter's Complete to raise your home you know you are in good hands because we use our proven process to guarantee success every time.

## The Process

### Phase I

We start with a pre-inspection of your home which allows us to identify any special needs that might arise during elevation. Then we obtain the permits needed to begin elevation.

### Phase II

The second phase of the process is preparing your home to be lifted. Then the Elevation begins with the Unified Jacking System. At this phase, you can decide on the stucco color, style of steps and hand rails for the home.

### Phase III

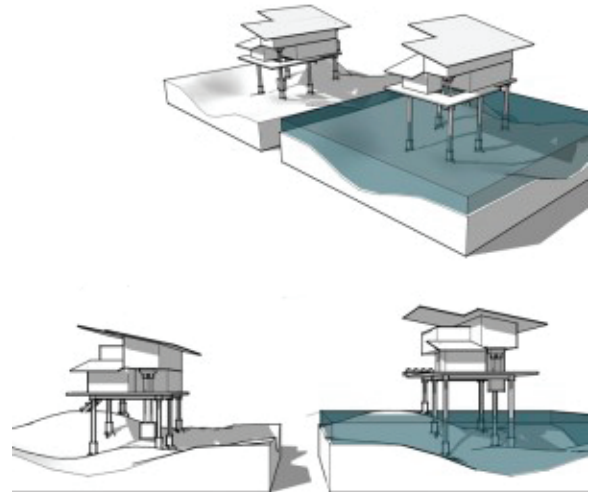

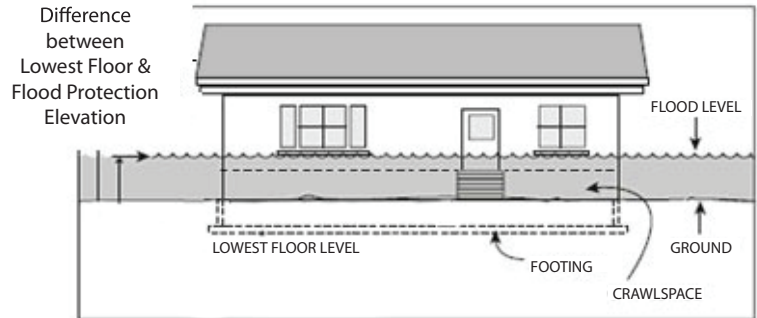

The third phase of the process is the installation of the pilings. These are what the house will rest on once the home has been lifted. The home will be attached to the pilings and all plumbing, AC, gas, and electrical will be installed to meet code for the new elevation level of the home.

### Phase IV

The footing is now poured around the perimeter of the home to lock exterior pilings in place. Upon completion, concrete blocks will be placed to fill the space between the footing and the original foundation of the home. Stucco will then be placed on the base of the home.

### Phase V

The fifth and final stage of the process includes install railings, site clean-up, and application for an elevation certificate. After which the site will pass a final inspection to be conducted by the Parish. Once the process is complete you can enjoy your newly elevated home.

## Accredited Business

Carpenters Complete is fully insured and state licensed.
